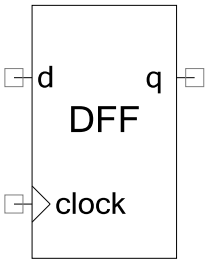
D Flip Flop
1.10

Features

- Stores a digital value
- Asynchronous Reset or Preset
- Optional array of D Flip Flops



General Description

The D Flip Flop stores a digital value.

When to use a D Flip Flop

The D Flip Flop should be used to implement sequential logic.

Input/Output Connections

This section describes the various input and output connections for the D Flip Flop. An asterisk (*) in the list of I/O's states that the I/O may be hidden on the symbol under the conditions listed in the description of that I/O.

d – Input

This input determines the next value of the output. The output does not change until the next rising edge of the clock.

clock – Input

The clock signal determines when the output will change. The output changes when a rising edge of the clock is detected.

ar – Input *

Asynchronous reset. When this input is true, the output will immediately change to false. This input only appears if the PresetOrReset parameter is set to Reset.

ap – Input *

Asynchronous preset. When this input is true, the output will immediately change to true. This input only appears if the PresetOrReset parameter is set to Preset.

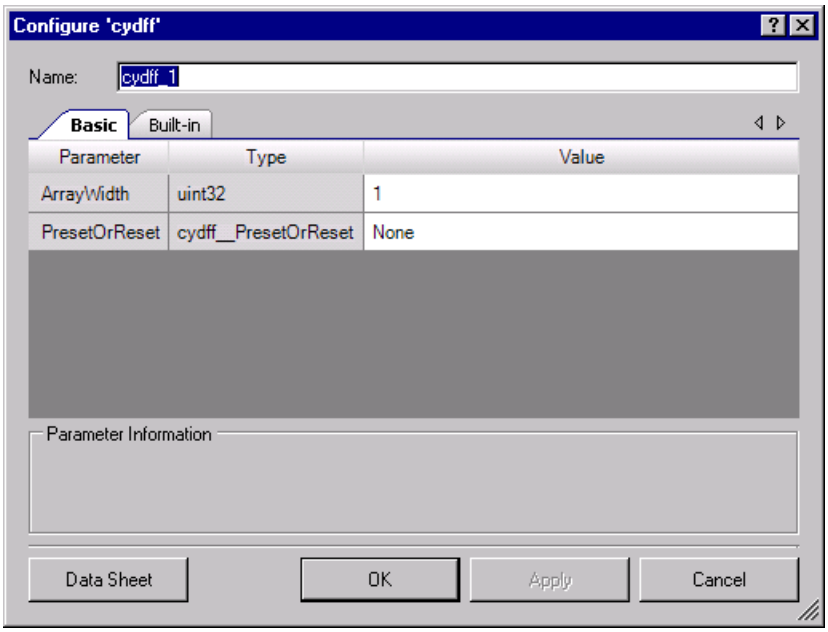
q – Output

The stored value of the D Flip Flop.

Component Parameters

Drag a D Flip Flop onto your design and double-click it to open the Configure dialog.

Figure 1 Configure D Flip Flop Dialog



The D Flip Flop provides the following parameters.

ArrayWidth

An array of the D Flip Flop can be created which may be useful if the input or output is a bus. This parameter defines the bus width of the d and q terminals. The default is 1.

PresetOrReset

This parameter controls whether the asynchronous preset (ap) input or asynchronous reset (ar) is visible. The default is None.

Placement

All D Flip Flop components in the same UDB must have the same ar or ap input. All D Flip Flop components in the same PLD must have the same clock signal.

Resources

The D Flip Flop uses one macrocell. If the ArrayWidth parameter is greater than 1, the D Flip Flop uses a number of macrocells equal to ArrayWidth.

Application Programming Interface

Not applicable

Functional Description

Not applicable

DC and AC Electrical Characteristics

The following values are indicative of expected performance and based on initial characterization data.

5.0V/3.3V DC and AC Electrical Characteristics

Parameter	Typical	Min	Max	Units	Conditions and Notes
Input					
Maximum Clock Rate	---		80	MHz	

Component Changes

This section lists the major changes in the component from the previous version.

Version	Description of Changes
1.10	Replaced NeedAP and NeedAR parameters with PresetorReset parameter.
